About

This TechTips document explains how to set up your appliance using Orchestrator instead of Cloud Portal as a proxy for scenarios where appliances are on a private network with no internet access. These instructions are only required if internet access to cloudportal.silver-peak.com is not permitted via backhaul over the MPLS network.

Set up Orchestrator as a proxy

1. Boot up your EdgeConnect appliance and retrieve the IP address on your management network.
2. Navigate to the appliance directly using the IP address.
3. Log in with your credentials.
4. In your appliance, navigate to **Silver Peak Cloud & Portal Orchestrator** (*Administration > Basic Settings > Silver Peak Cloud Portal & Orchestrator*).
5. In the **Orchestrator** field, enter the IP address of your Orchestrator.
NOTE Do not update the **host** or **port** fields and do not configure the DNS settings on your appliance.
6. In your appliance, navigate to the **Administration** tab (*Administration > License and Registration*).
7. Copy and paste the account name and key into the appropriate fields.
8. Select **Apply** and navigate back to the **Silver Peak Cloud & Portal Orchestration** tab.
NOTE If the Management Interface of the EdgeConnect is not on the same subnet as the Orchestrator, you need to navigate to the Management Routes tab and add a route to the Management Route Table.
9. Refresh your screen after a few minutes. The following alarm should display: "**Appliance Registered but not Approved.**"
10. Navigate to **Discovered Appliances** in Orchestrator (*Configuration > Discovery > Discovered Appliances*). You should see the appliance you just configured.
11. Select **Approve**.
